Financial Impacts of Extreme Weather

President's Council of Advisors on Science and Technology November 9, 2022

Solomon Hsiang, UC Berkeley

Maria: The Worst Atlantic Storm on Record

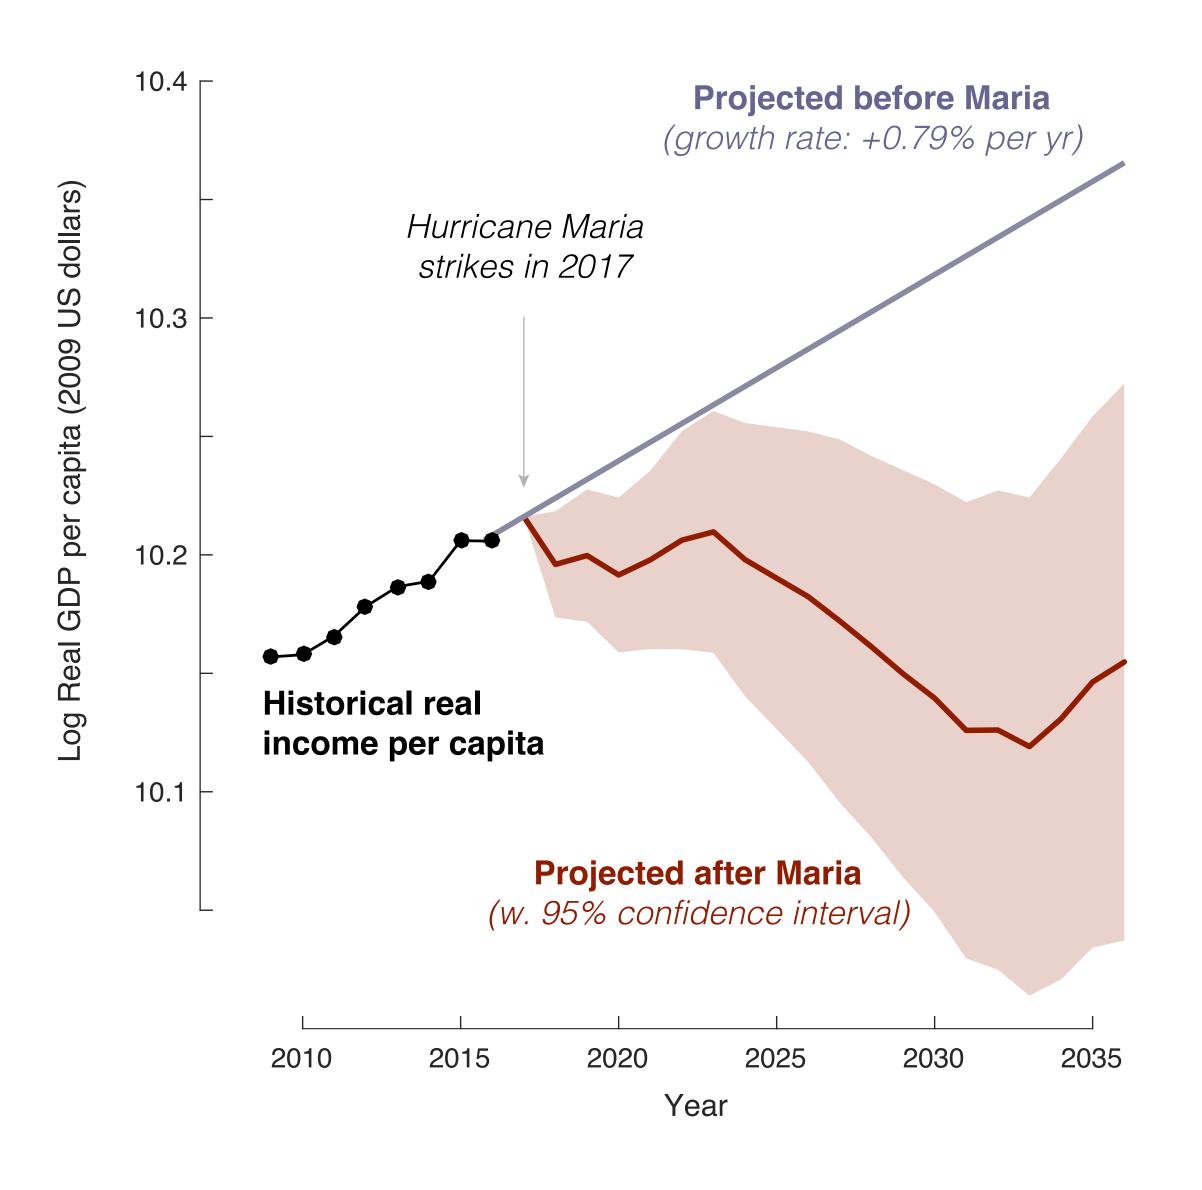

The ten strongest cyclone events since 1950.

RANK, LOCATION	YEAR	AVERAGE WIND SPEED OVER LAND
1. Northern Mariana Islands	1997	175 miles per hour
2. Guam	1997	152
3. Guam	1992	147
4. Hong Kong	1983	135
5. Guam	1962	131
6. Puerto Rico	2017	123
7. Northern Mariana Islands	1980	123
8. Cayman Islands	1988	120
9. Dominica	1979	118
10. Montserrat	1989	117

Undoing 23 years of economic progress in 12 hours

Hsiang & Houser (NYT, 2017)

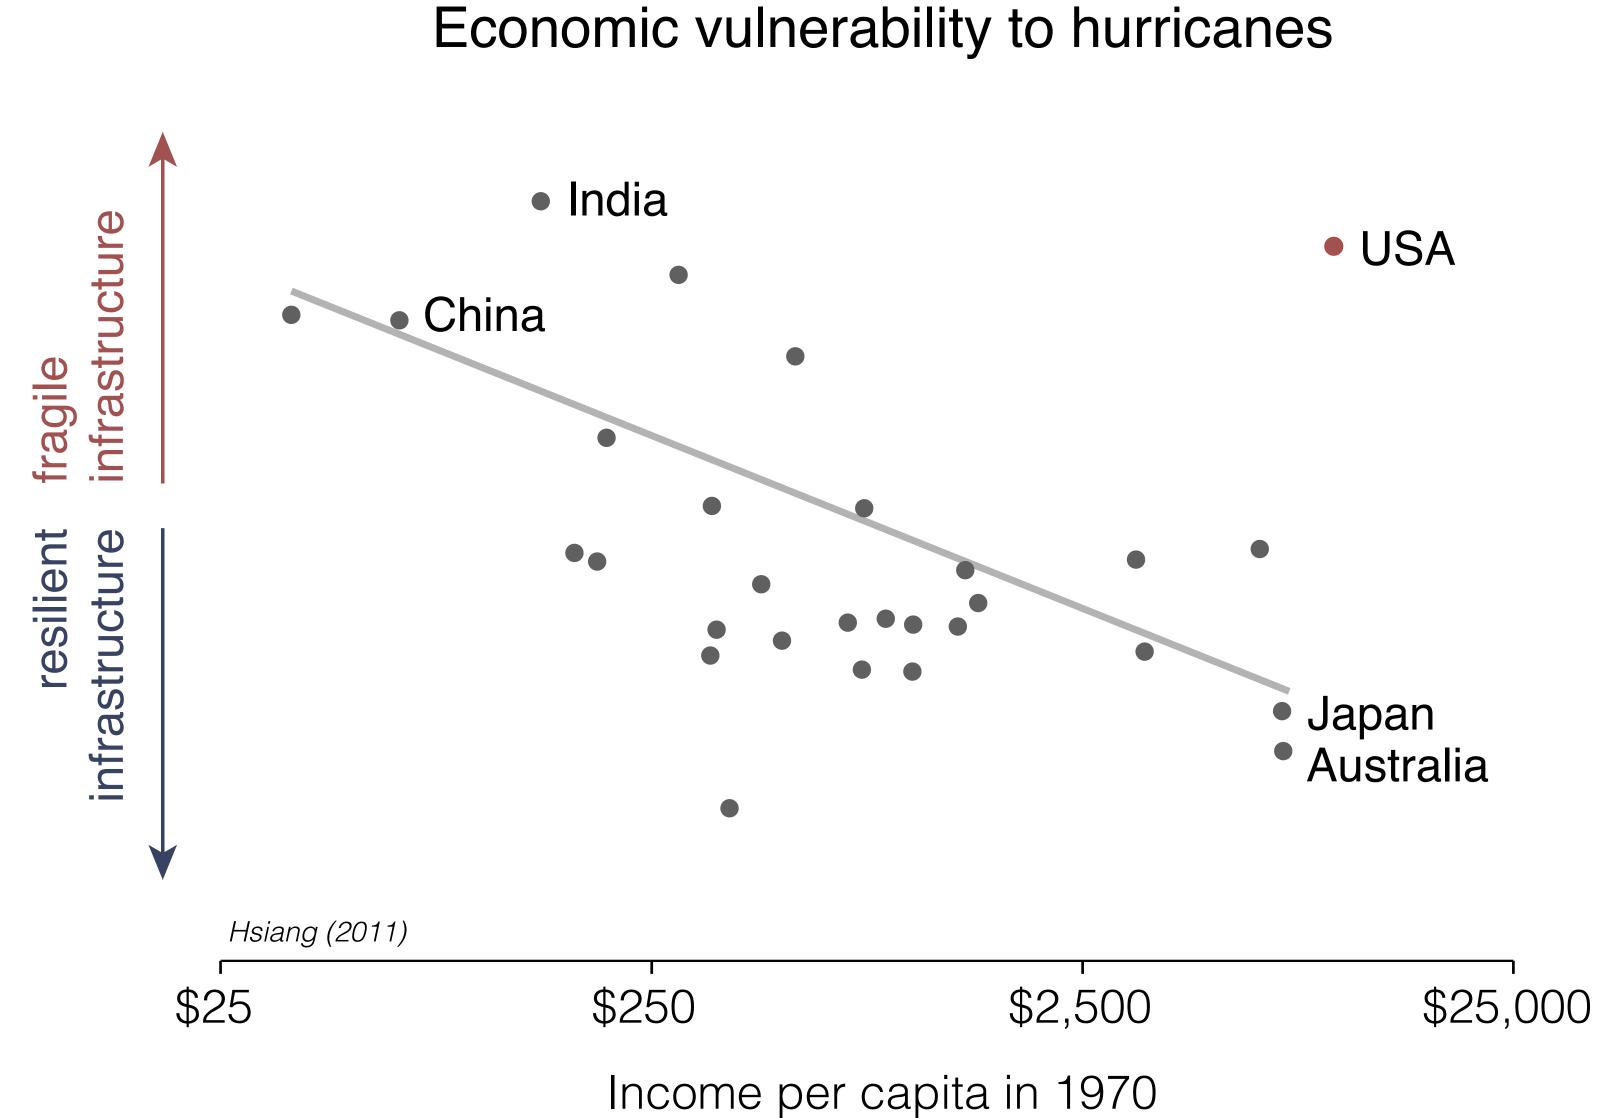

In Just 12 Hours, an Economic Wipeout

Hurricane devastation in Puerto Rico is expected to have much worse economic effects than many other recent crises that unfolded over months or years.

ECONOMIC DISASTER	YEARS	DROP IN PER CAPITA	G.D.P.	
Asian financial crisis: Thailand	1997-99	-25%		
Great Recession's effect on Nevada	2007-09	-22%		
Hurricane Maria in Puerto Rico	2017	-21%		
Asian financial crisis: Indonesia	1997-99	-21%		
Great Recession's effect on Arizona	2007-09	-18%		
Great Recession's effect on Michigan	2007-09	-13%		
Average international financial crisis		-9%		Novada Arizana and
Great Recession: U.S. overall	2007-09	-9%		Nevada, Arizona and Michigan were among
U.S. recessions	1980-1982	-8%		the hardest-hit states
Mexico peso crisis	1994-95	-8%		in the Great Recession of 2007-09.
Average international banking crisis		-8%		
1-in-10 cyclone event		-7%		
U.S. recession	1990-1991	-7%		
Average cyclone event		-4%		
U.S. recession	2001	-3%		

Hsiang (Columbia Univ., 2011)

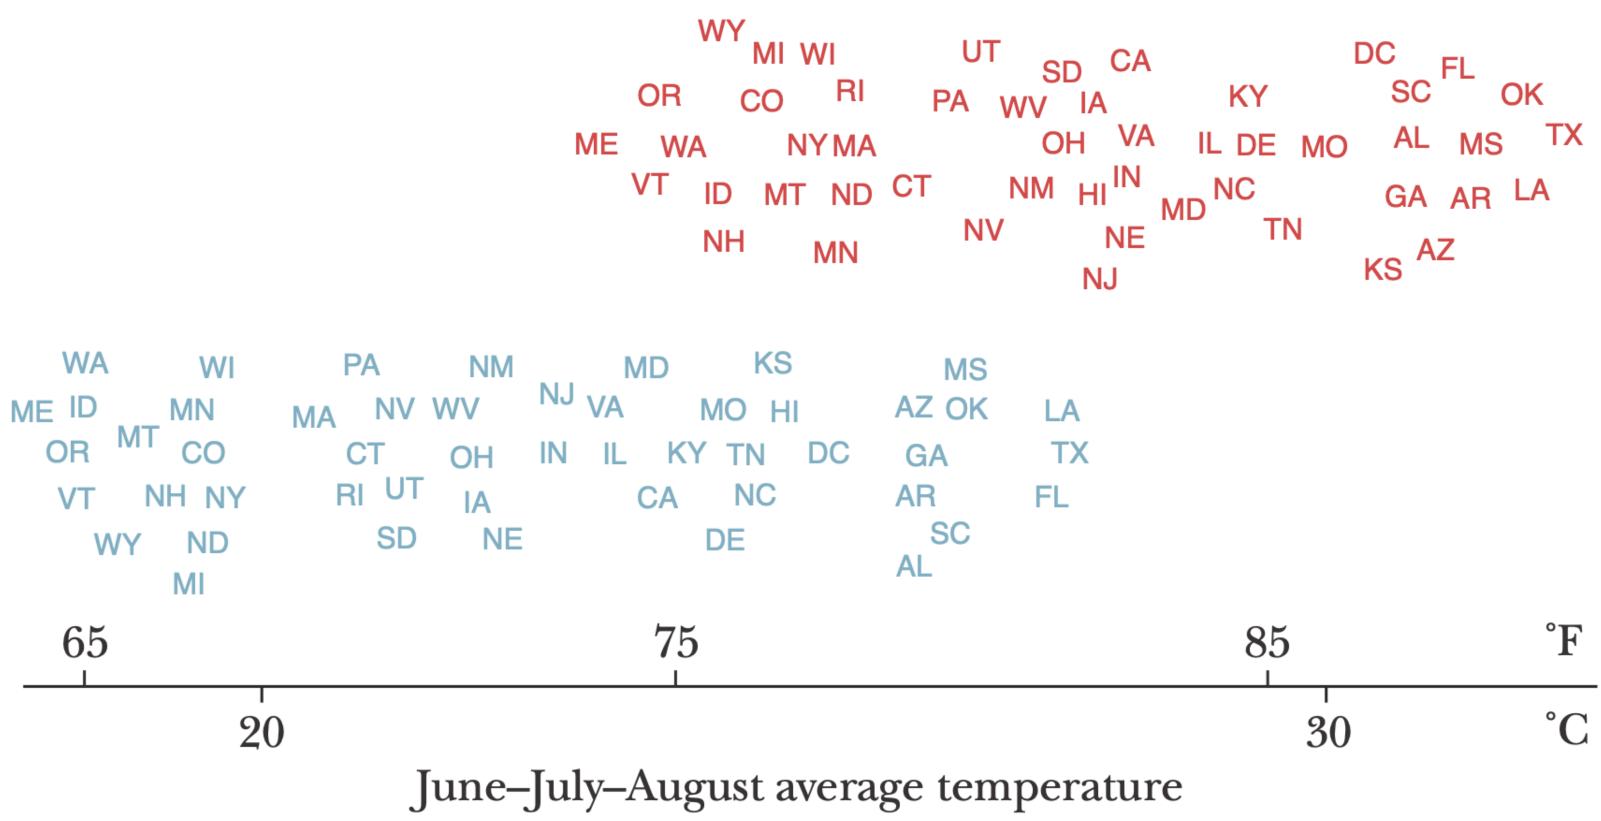

Average Temperatures for Lower 48 US States Observed during 1981–2010 and **Projected for 2080–2099 in a High Emission (RCP 8.5) Scenario.**

A: States (USA)

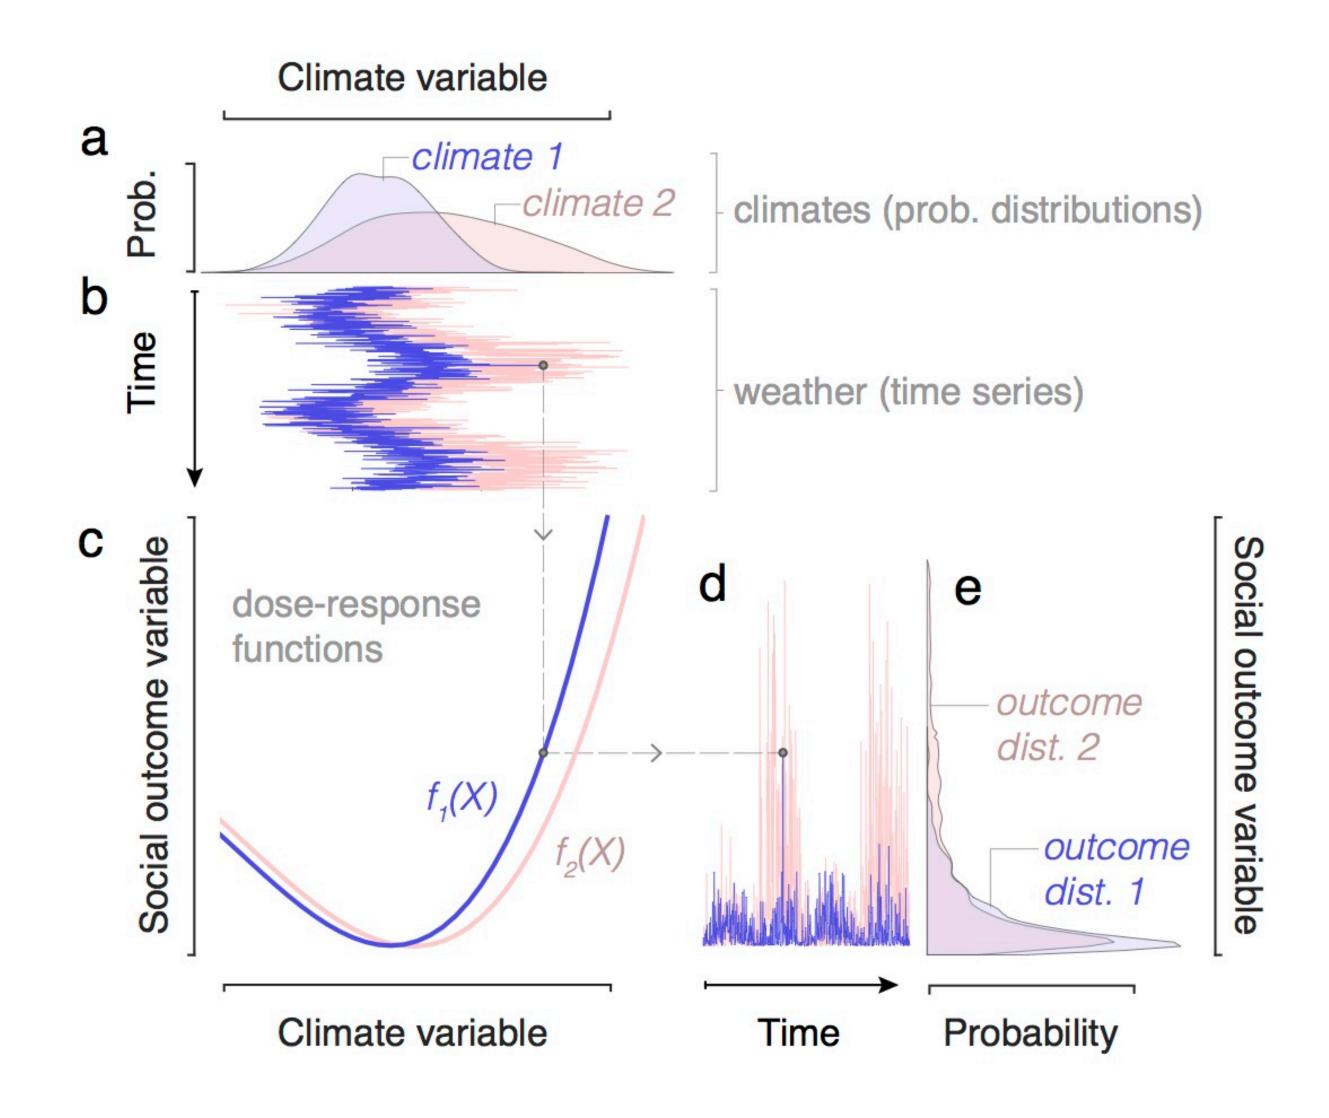

2080-2099 high emission (RCP 8.5) scenario

> 1981-2010 (Historical)

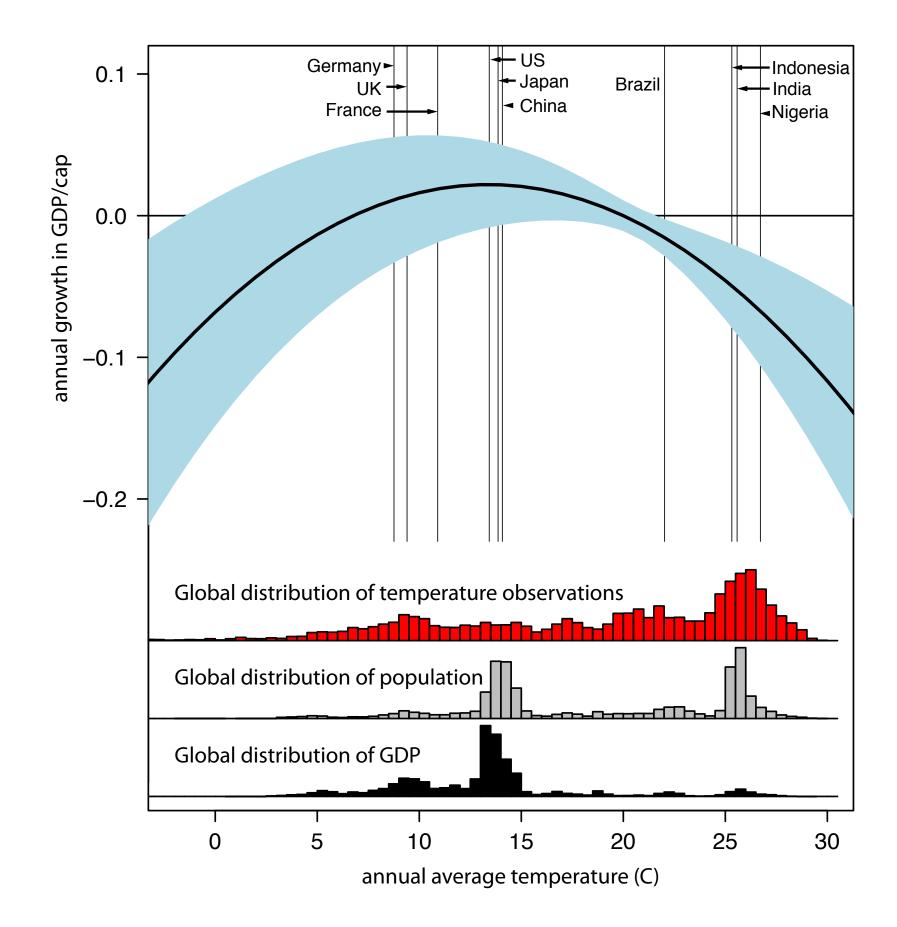

Measuring impacts

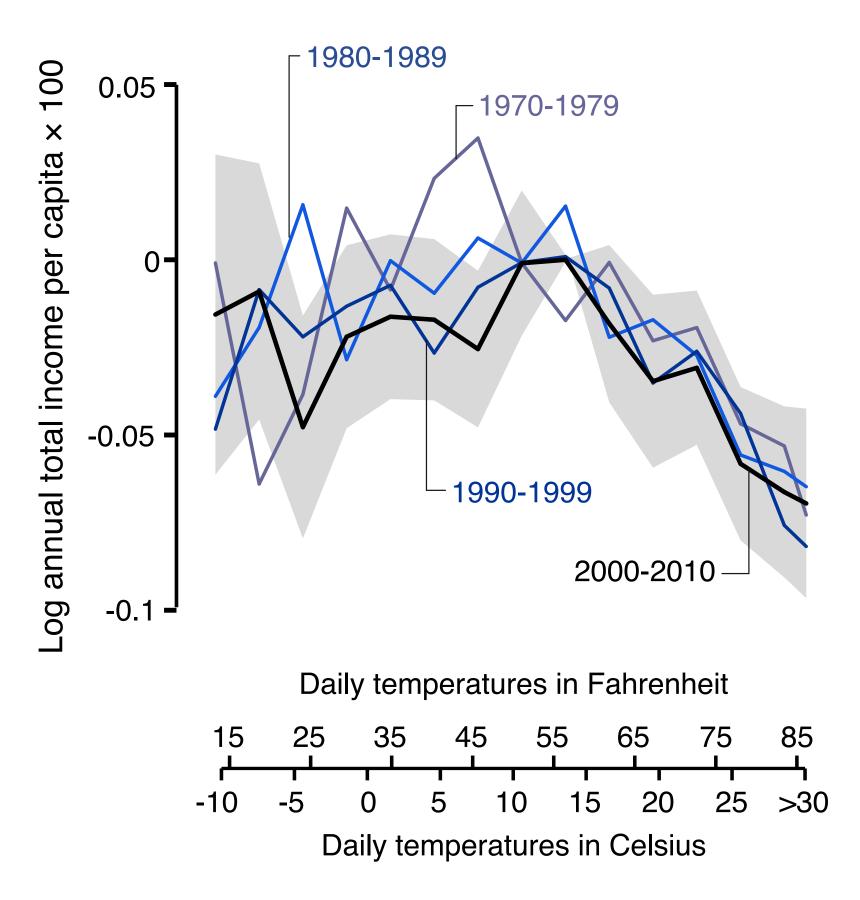

Climate change and economic output

World

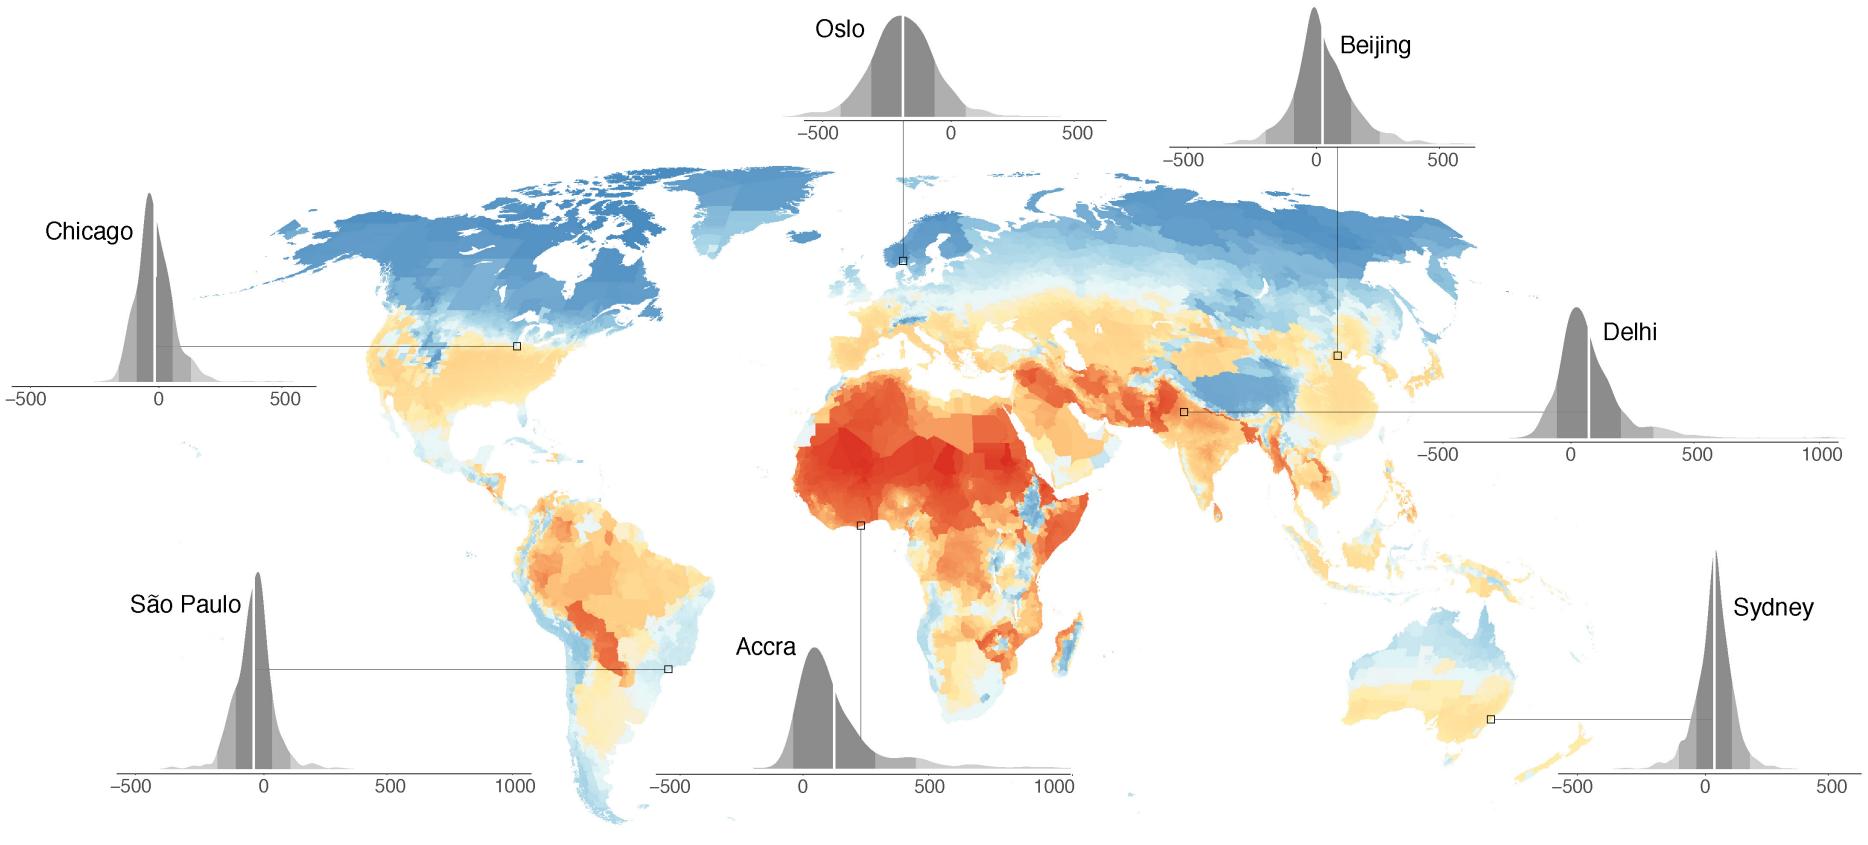

Burke, Hsiang, Miguel (Nature, 2015)

Impacts on human health

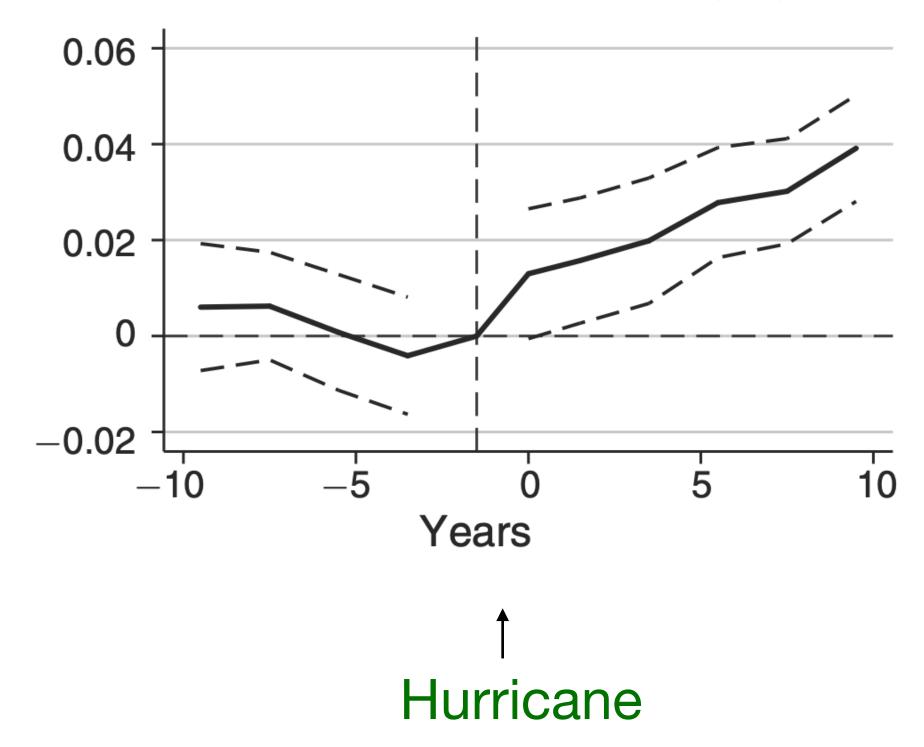

Full mortality risk of climate change in 2100 (deaths per 100,000)

	. I .			- 1 - E	1	1												1		
-1000	-900	-800	-700	-600	-500	-400	-300	-200	-100	0	100	200	300	400	500	600	700	800	900	1000

Fiscal Costs > Disaster payments

Panel A. Per capita trans. from gov. (log)

	Category 1	Category 2	Category 3+
	(1)	(2)	(3)
Average wage/salary	-492	-800	-4,333
	(582)	(1,041)	(1,456)
Transfers from businesses (private insurance)	17	20	86
	(9)	(13)	(43)
All non-disaster transfers from government =	1,107	1,100	1,698
	(291)	(511)	(718)
Unemployment payments +	46	66	421
	(57)	(75)	(131)
Public medical benefits +	633	583	361
	(178)	(250)	(344)
Medicare benefits +	353	211	140
	(100)	(145)	(221)
Retirement and disability insurance benefits +	164	119	402
	(129)	(233)	(458)
Federal educational assistance +	-33 (16)	-28 (30)	-45 (46)
Income maintenance =	188	-84	515
	(84)	(134)	(260)
SSI benefits +	-23 (26)	66 (46)	128 (68)
Food stamps +	94	38	383
	(45)	(65)	(151)
Family assistance	38	95	138
	(24)	(40)	(71)

TABLE 11—TOTAL CHANGE IN TRANSFER COMPONENTS BY HURRICANE CATEGORY (present discounted value)

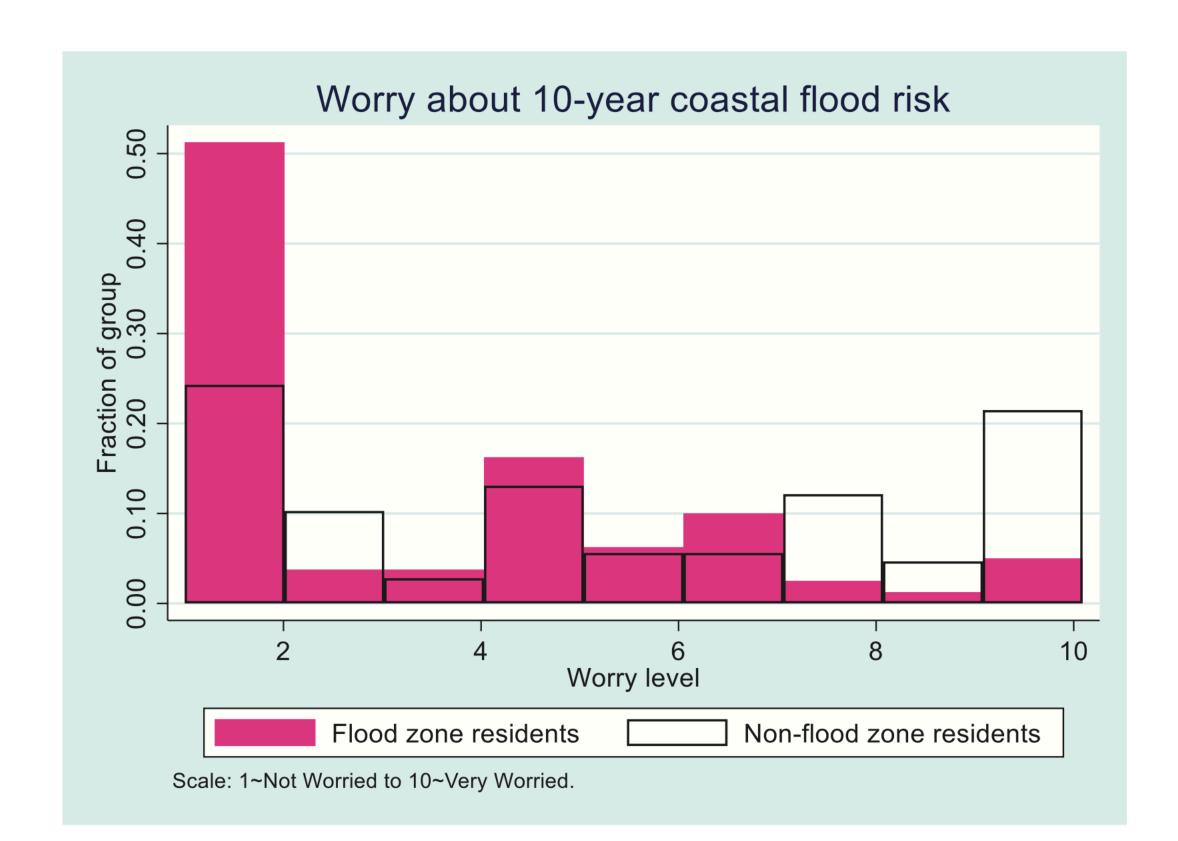

Notes: The table shows the present discounted value of additional inflows of various transfers zero to ten years after the hurricane by hurricane category. Standard errors (in parentheses) are clustered spatially, allowing for spatial correlation of up to 200 km around the county's centroid and for autocorrelation of order 5. Assumed interest rate is 3 percent. Data are estimated with a nonlinear combination of coefficients from equation (3).

Revaluation of real estate assets

Mueller et al (J. Real Estate Finance & Econ, 2009)

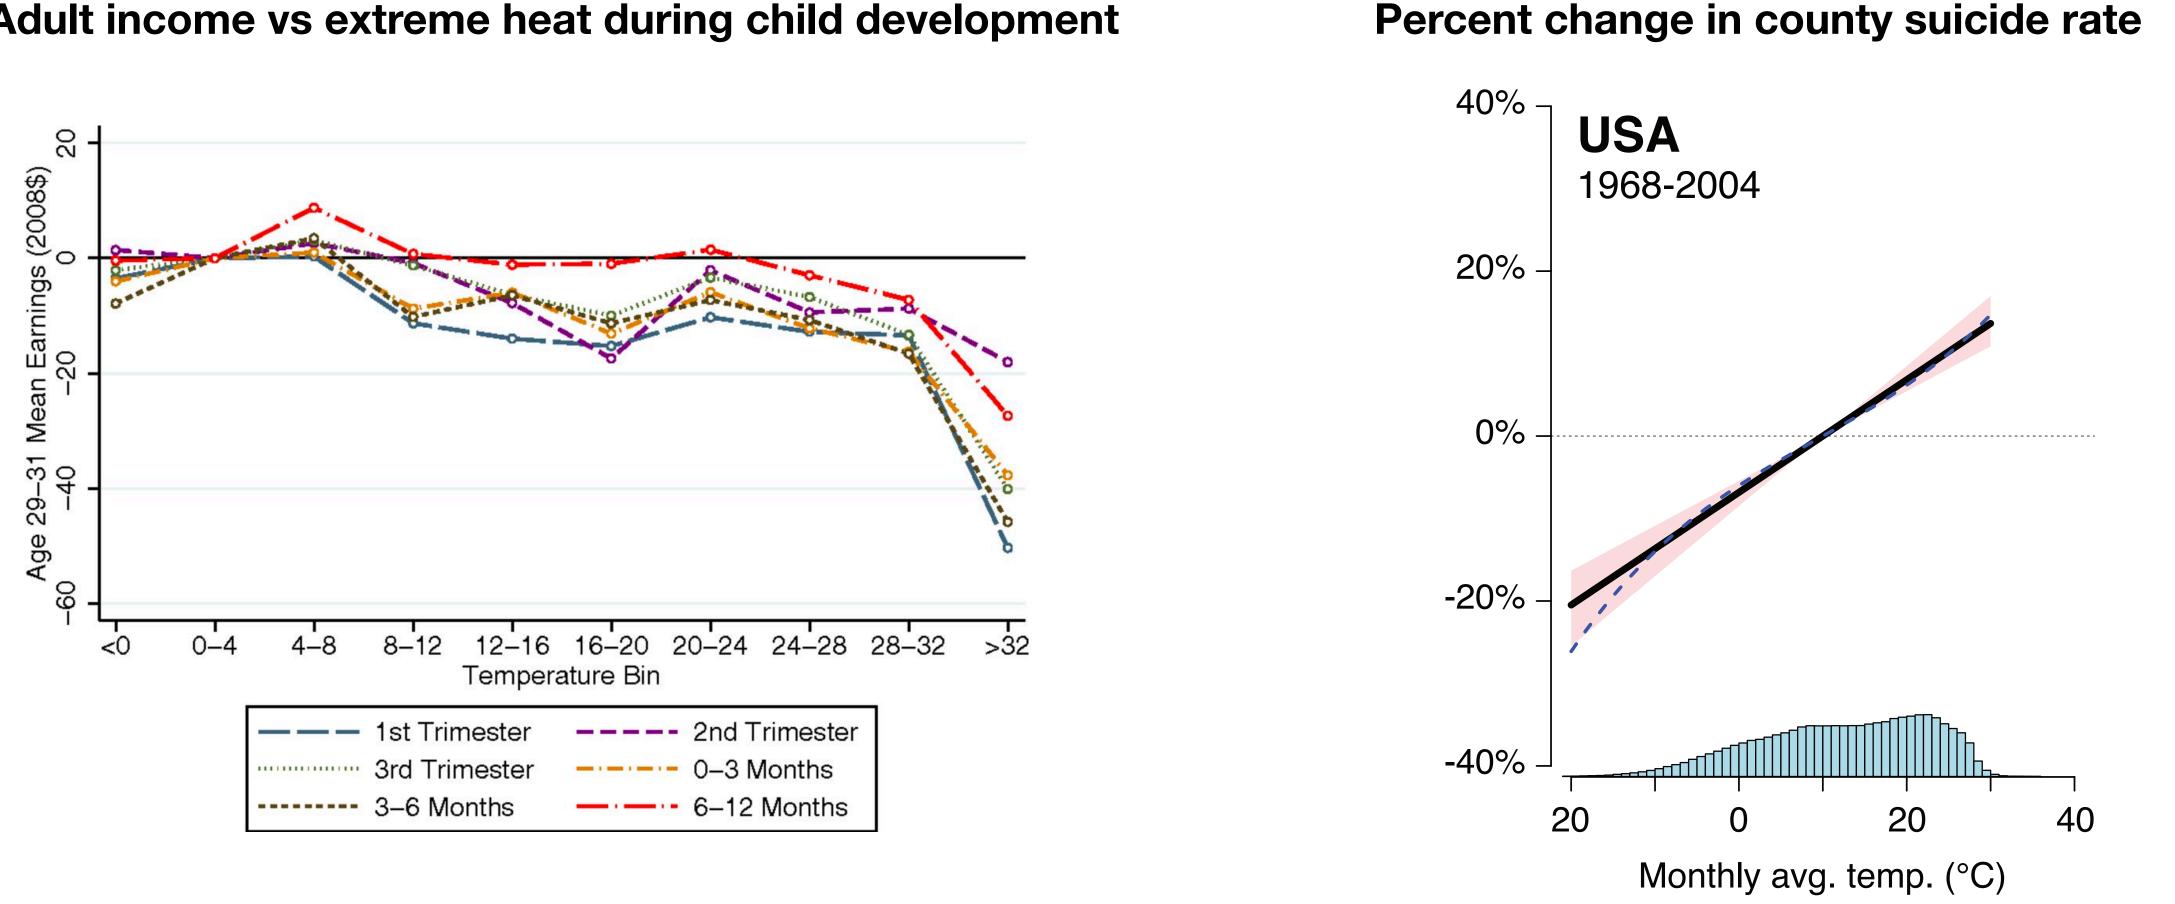

Bakkensen & Barrage (Rev. Financial Studies, 2021)

Impacts within the home

Adult income vs extreme heat during child development

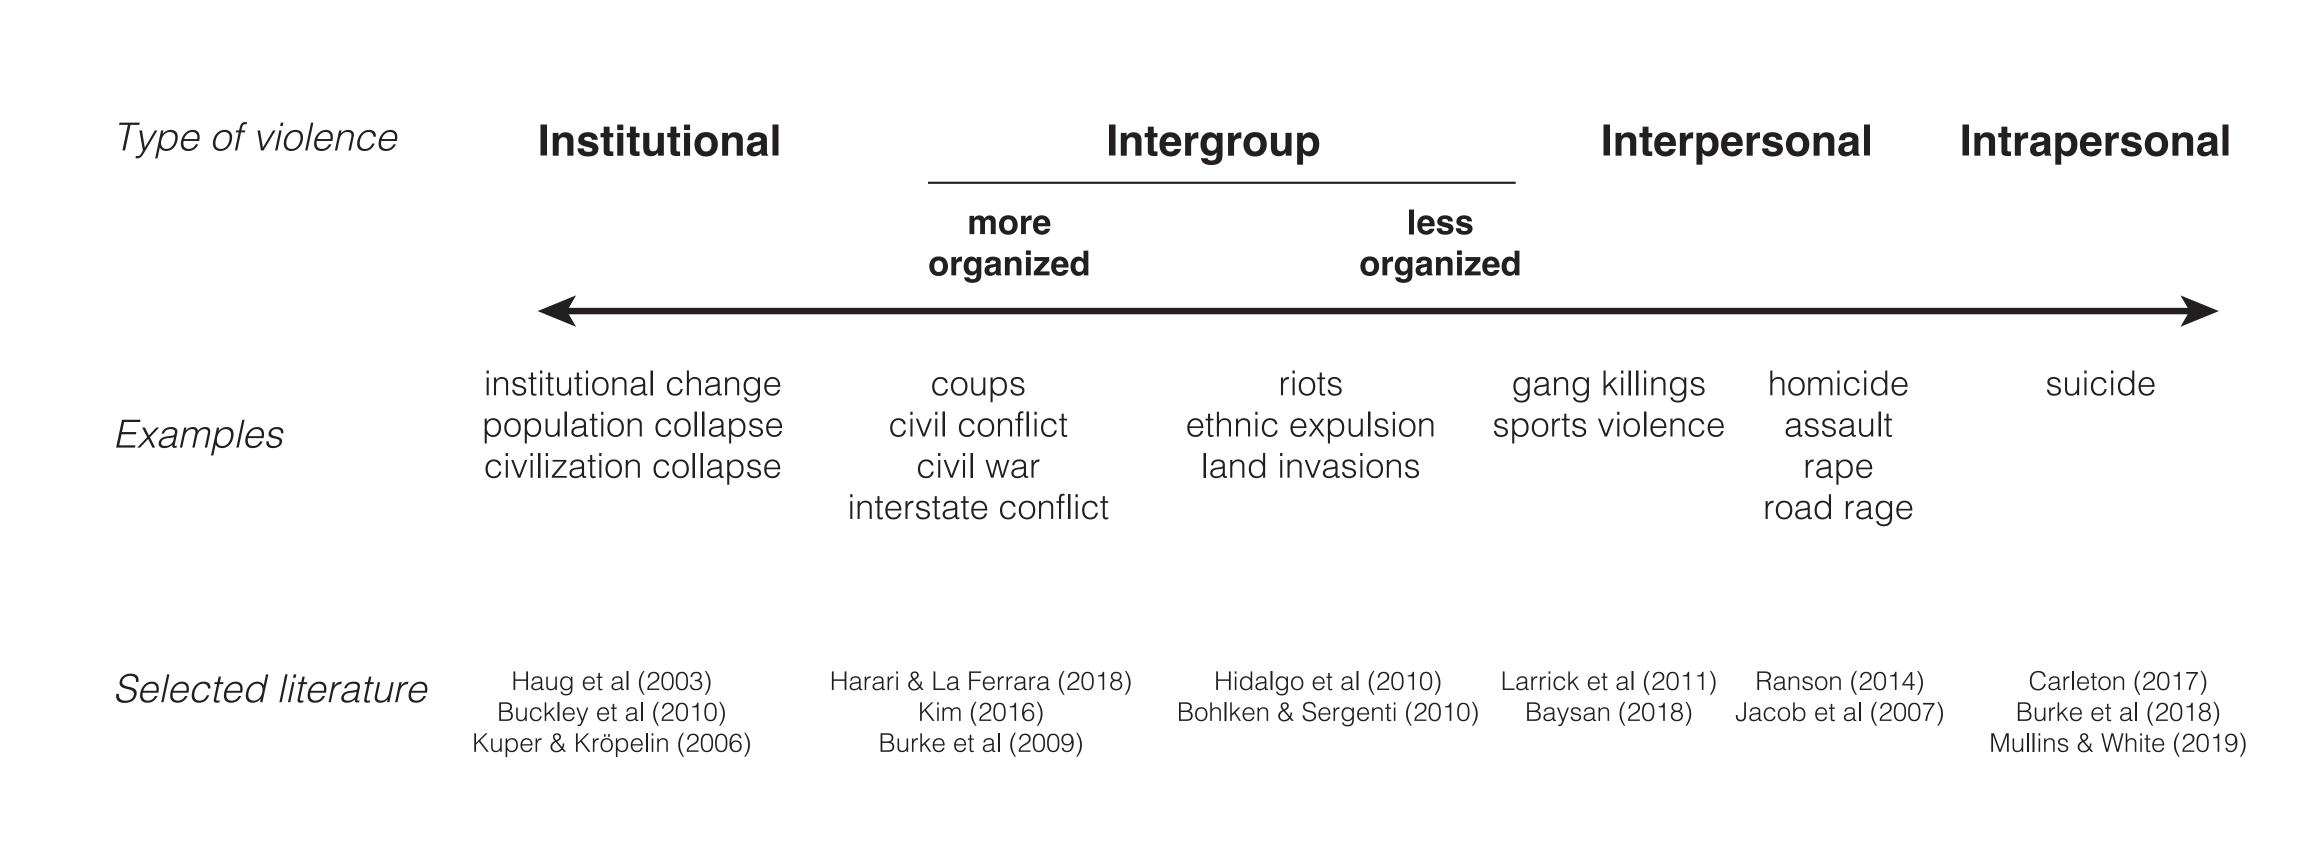

Isen et al (PNAS, 2017)

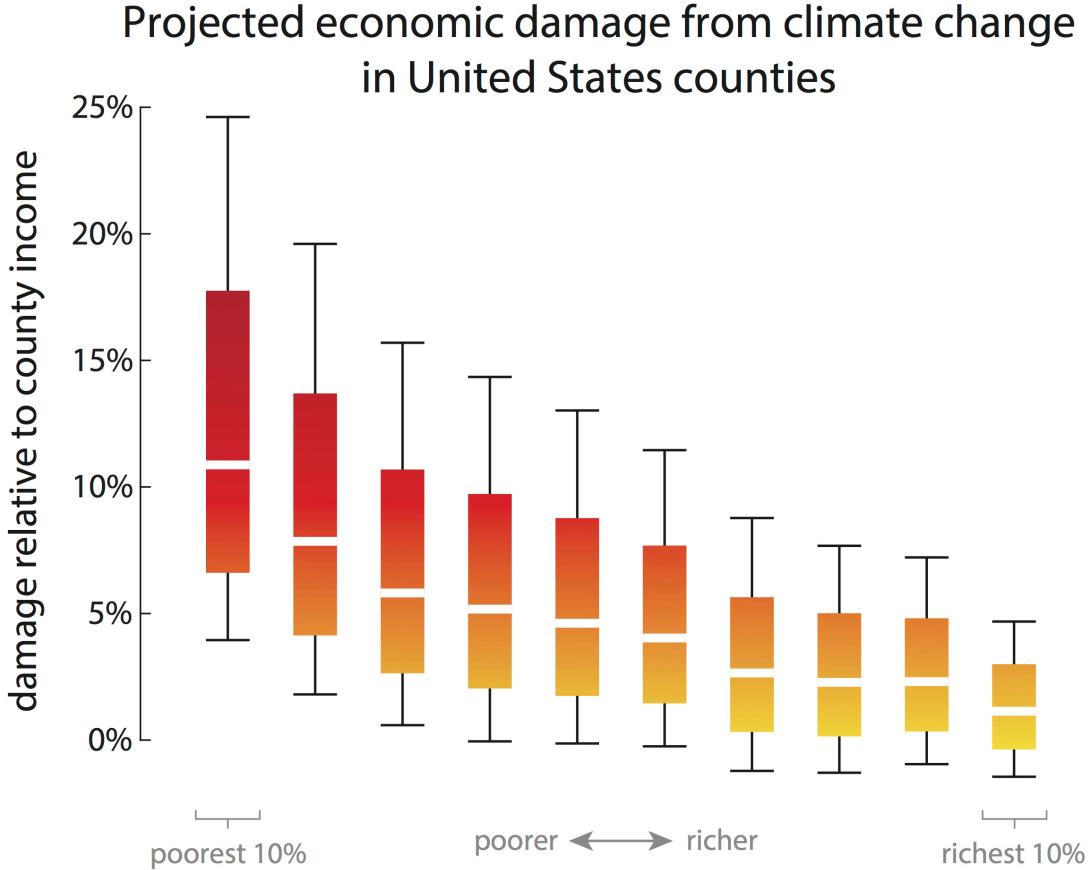

Burke et al (Nature Climate Change, 2018)

Climate affecting violence & social stability

Impacts can increase pre-existing inequality

US counties in order of current income per person

Institutions for supervising adaptation technology & data

- There are / will be massive efforts to minimize economic damages from climate change.
- There are no institutions to ensure data / policies / technologies are "safe and effective"
- Ineffective technologies defraud consumers and disclosure of inaccurate climate risk data may harm unaware citizens.

Recommendation:

Develop systems for third-party supervision / verification of technologies and data (e.g. RCTs, audits) to protect consumers (e.g. cities, homeowners).

World Health Organization

CENTERS FOR DISEASE CONTROL AND PREVENTION

We do not have comparable institutions for climate-related policies or technologies

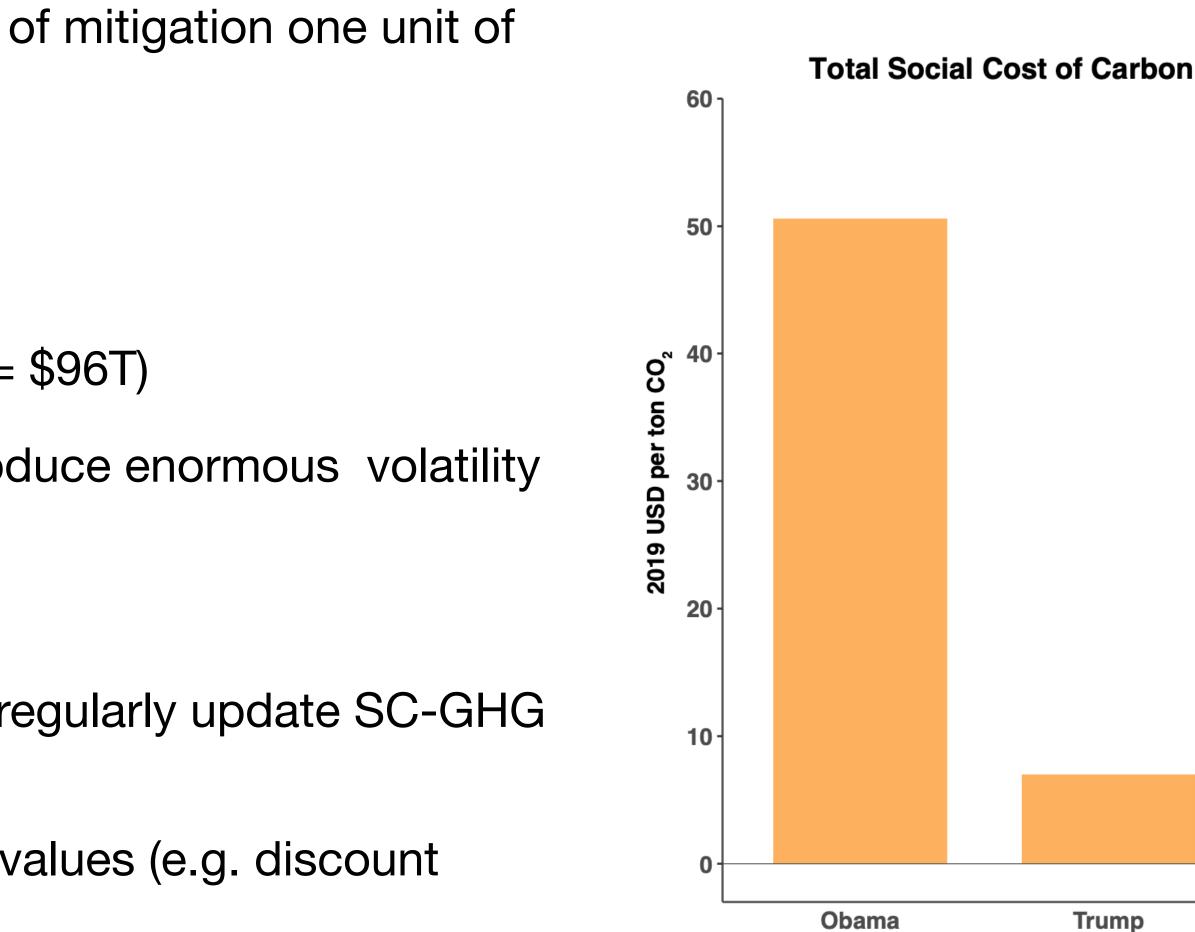

Social Cost of GHGs

- SC-GHG is an estimate of the net present value of mitigation one unit of emissions today. Used to "price carbon".
- Global CO2 emissions = 40 billion tons
- Suppose SC-GHG = 60 / ton CO2
- Annual emissions valued at \$2.4T (Global GDP = \$96T)
- Repricing (e.g. altering discount rate) could introduce enormous volatility into markets if US SC-GHG is widely adopted.

Recommendations:

- Systematize and codify scientific process to regularly update SC-GHG based on best available science.
- Set "speed limits" on how rapidly parameter values (e.g. discount rates) may change to limit volatility.

U.S. EPA (2017)

IWG (2016)

Fiscal Planning

- Many legacy systems were designed prior to climate change but "bear the weight" of climate-related costs (e.g. public unemployment insurance, private healthcare)
- Either existing systems / programs must expand to manage costs or we must design / deploy new ones
- Moral hazard is pervasive across adaptation planning contexts

Recommendations:

- Index budgets and financial systems against climate change to improve fiscal sustainability (analogous to indexing to inflation)
- Incentivize measurable risk reduction across all planning levels
- Phase out ad hoc discretionary relief programs (presidential disaster declarations), replace with financially sustainable risk-sharing systems (e.g. unsubsidized crop insurance / NFIP)

Coordinating /supporting adaptation investment

- Adaptation to climate change will be decentralized and executed at multiple levels of government
- Coordination failures may be extremely costly (e.g. electrical grid planning, interstate surface water allocations)
- State & local governments may lack resources / expertise to evaluate cost-effectiveness of adaptation technologies / strategies

Recommendations:

- Review existing adaptation coordinating mechanisms, establish cross-level / cross-regional / crosssectoral systems to coordinate actions.
 - Signal priorities centrally (e.g. WH) to facilitate coordination.
 - Incentivize transfer of savings across programatic areas (e.g. FEMA buyback program)
- Create / disseminate systems to support technical aspects of local / state adaptation planning.
- Expand education programs to develop the interdisciplinary labor force needed for national adaptation.
